# TELMILK®

## Calf milk replacers

TELMILK calf milk replacers (CMR) contain a high proportion of quality dairy ingredients and milk protein. The fat base includes lard, which has a very high digestibility. The basic ingredients of TELMILK CMR are skimmed milk powder, standardized whey and whey proteins. Cheaper product ranges, designed for calves from the end of the 4th week of age, include a high-quality soy protein concentrate. TELMILK CMRs are manufactured using an independent automated technology, which ensures high quality processing.

TELMILK CMRs contain **Immuno-complex**, a balanced formula with vitamins, minerals and probiotics, which help the immune system of calves to function properly, and a new-generation multicomponent acidifier, which has a positive effect on the digestive tract of calves, while maintaining the maximum palatability of a milk replacer.

Milk replacer		TELMILK START (50% of SMP**)	TELMILK SPEC (13% of SMP**)	TELMILK EX
Product Code		631 350	631 310	631 300
Proteins	%	21.6	21.4	22
Fats	%	20.6	18.8	17
Dairy ingredients*	%	80	61	55

\* The actual proportion of dairy ingredients in CMR excluding the fat content. \*\* Skimmed milk powder.

### ● Use

**TELMILK START** – a premium milk replacer, intended for feeding calves from birth to weaning; contains 50% of high quality skimmed milk powder and has a balanced milk protein/energy ratio. It does not contain any vegetable sources.

**TELMILK SPEC** – basic milk replacer with a high milk/whey protein content; contains 13% of skimmed milk powder and is suitable for calves throughout the birth to weaning period or as second ("follow-on") milk replacer (following TELMILK START, ideally from the end of the 4th week of age).

**TELMILK EX** – milk replacer with a balanced milk/vegetable protein ratio, suitable for calves from the end of the 4th week of life. It is suitable for mixing with hygienically safe nonsaleable milk.

### ● Milk Mixing powder reconstitution

TELMILK reconstituted milk replacer powder – mix 1 kg of TELMILK CMR powder with 7 litres of water (145 g of CMR powder per 1 L of water). In case of automatic calf feeders, use 145 g of CMR per 1 litre of water. For hand feeding, add 1 kg of CMR powder into 4 litres of warm water (45–50°C) and mix thoroughly. Then top up with 3 litres of water to achieve a temperature of 39 to 40°C of reconstituted milk replacer right before feeding. Do not dissolve in water warmer than 50°C.

### ● Feeding

After the colostrum period, feed 2 to 3 TELMILK meals of 2.5–3 litres daily to achieve a total of 5 to 9 L per calf per day. Observe optimal feeding intervals (8 to 12 hours). In the winter months it is advisable to increase the volume of meals or increase the frequency of daily feeding. Do not increase the CMR powder dosage per 1 litre of water. A highly concentrated milk replacer drink can cause dietary nutritional scours.

We will be happy to help you with the comprehensive management of calf rearing.

**Our TELMILK CMRs are regularly checked for nutrient contents and microbiology.**

**Packaging:** in 25kg bags, 750kg pallets.
